Guilherme Keidi Suzuki

Web developer and digital strategist. I build AI systems that run in production, and I can show the numbers.

26 years old. Founder of Cuoncient. Clients in Brazil and in Massachusetts, USA.
WhatsApp +55 (11) 93352-8251, cuoncient.com/gui, github.com/yugksuzuki

What I put AI to work on

Each item below exists and is running for a real client. Open any of them to see how it was built and what it costs.

Blog engine
Art 7 Epoxy, USA

Writes and checks local SEO articles three times a week and leaves each one ready for a person to publish.

> 14 validation rules. If a draft fails, the AI rewrites it up to 3 times. US$ 0.10 to 0.21 per article.

RAG over the client's pages
Art 7 Epoxy, USA

Searches the site by meaning, so new city pages can be written without repeating the ones already live.

> 51 pages, 526 passages indexed. A batch of 8 new pages was written with zero runs of 10+ words copied from the site.

Invoice panel
DUACT, SC

Reads the order sheet every morning, builds the invoice order through the ERP's API and closes the total to the cent.

> Orders of 80 and 103 lines created through the API. Exceptions described in plain text become line items proposed by Claude. The final click to issue stays with a person.

Video engine
BR Oxigênio, GO

One webhook call becomes finished ads in the client's folder: 9:16 and 4:5, with and without captions.

> About 3 minutes per render, 10 files per delivery, audio normalized to −14 LUFS. Extra cost close to zero.

The operation's brain
Cuoncient, in-house

A shared memory: two Claude accounts and the n8n routines read and write the same vault of notes.

> Morning brief on weekdays at 6:40, weekly review on Fridays, 77 files versioned on GitHub.

Landing page from Instagram
Cuoncient, client landing pages

Collects the client's profile, stores photos and captions in a repository and hands over the context to build the page.

> 50 posts collected in 3 to 5 minutes, for cents. Fixed rule: address, price and testimonials are never made up.

AI product photos, checked by hand
Center Conveniência, PR

AI only fills in where no real photo exists, and every generated image is checked against the real packaging.

> 260 of 260 products with a photo: 199 imported from the old menu, the rest generated and reviewed. 8 rejected for the wrong color or version.

Weekly page watch
Art 7 Epoxy, USA

Every Monday at 10:00 it crawls the sitemap and files a report with the template mistakes that slipped through.

> It looks for things like the model city's name left behind in the text, FAQs and alt text of other cities' pages.

Store and taxes through the API
DUACT, SC

Tax discount and tax group applied product by product through the API, so checkout lands exactly on the catalog price.

> 105 products adjusted and checked against Wix's own tax calculation: 98 exact, 7 one cent below.

Ad performance analysis
V.BIKE, SC

Meta Ads exports read in Python to decide what to change and what to leave in the learning phase.

> Cost per conversation dropped to R$ 2.50 in one location after fixing the targeting. The best ad set reached R$ 2.02.

Proposals that become web pages
Cuoncient and HotelariaWeb partnership

A sales proposal published as a page with its own link, ready to send on WhatsApp, with a PDF as backup.

> The B2B storefront proposal went from conversation to live link on the same day.

Processes turned into Claude skills Cuoncient, in-house

What worked once becomes a reusable instruction, so the next project starts from the best version.

> Skills such as Instagram landing page, page visual review, consolidated proposal and the Cuoncient web stack.

Products I built in code

All shipped in 2026, with Claude in the process from the first line to the automated tests. Every one is live.

Kashi

App to learn Japanese through the songs you like: automatic furigana, translation and lyrics in sync with the video. Works offline as an installable app.

36 automated tests. Three.js, GSAP, kuromoji.

jpcourse.cuoncient.com

Center, store and management

Online store, owner dashboard, courier app, counter POS with barcode scanner, stock fed by purchase invoices (XML), consumer e-invoices and an Android app.

Next.js 16, Firebase, Three.js (a 3D fridge you can shop from).

loja.cuoncient.com

Judzi, B2B storefront

Wholesale storefront that reads the client's Shopify catalog. Prices never show up for the public, and the full order goes out on WhatsApp.

332 products, 324 static pages, tests that block any leaked price.

judzi.cuoncient.com

Gabriela Seleme

Bilingual site for a visual artist, built like a gallery: one artwork per screen and a full-screen film of her at work.

54 tests, Lighthouse in CI, security headers.

gabrielaseleme.com

Eloá

Launch page for a wellbeing and routine app, with its own visual identity.

Tailwind, GSAP, esbuild.

eloa.cuoncient.com

Lúmen Editora

Redesign proposal for a publisher's site: catalog by genre, a page per author and the current launch up front.

lumen-editora.cuoncient.com

Cuoncient, the agency

Portfolio in three languages with the 55 sites delivered on Wix before the move to code.

Zero-dependency HTML, CSS and JS.

cuoncient.com

A client site, before and after

Art 7 Epoxy complained the site was slow on phones. Between October 15 and 17, 2026, I found the causes and fixed them. Google PageSpeed scores:

71 Home page, phone was 39 **80** City page, phone was 22 **98** Home page, desktop was 84

Main thread blocked on the home page	Home page HTML	Font files
~~1,440 ms~~ **10 ms**	~~627 KB~~ **272 KB**	~~231 KB~~ **65 KB**

What was slowing it down

- A page transition curtain held the screen blank until the next page painted.
- A 355 KB banner was pasted inside the HTML of every page. It became a 49 KB WebP.
- Chat, forms, pixel and Google tag loaded upfront. Now they wait for the visitor's first interaction or for the form to come close.
- reCAPTCHA weighed 695 KB on 18 forms that were already protected by a honeypot. It came out.
- Thirty small CSS files and blocking scripts became one file, with scripts deferred and the hero image preloaded.

Where I work

Cuoncient Founder

My own agency: design, social media, development and ads. It started with 55 sites delivered on Wix, and in 2026 it moved to its own code with AI built into the process.

DUACT Developer, invoicing and e-commerce

Electric scooters in Porto Belo, SC. I issue the invoices through OMIE, run the Wix store and parts catalog, and automated the invoice queue.

Art 7 Epoxy LLC Digital marketing and web, USA

Epoxy floors in Massachusetts. Local SEO with city pages, Google Ads and Local Services Ads, the AI blog engine, site speed and reports.

HotelariaWeb partnership Social media and paid traffic

Social media and Meta Ads for the partnership's clients, such as BR Oxigênio, a medical and industrial gas supplier in Goiás. Proposals and launch sites.

2026, month by month

May First city pages for Art 7 Epoxy, built in Elementor.

Aug Five-step quote calculator for Art 7, with leads going to HubSpot.

Oct RAG over the Art 7 pages, Judzi, Kashi, Center, the video engine, the speed overhaul and the invoice panel.

Jul Meta Ads for V.BIKE in two locations, read with Python. Pitch and stack for Gabriela Seleme's site.

Sep The blog engine goes live. The operation's brain starts: vault, n8n and two Claude accounts.

What I use every day

AI	Claude (API, Claude Code, Skills, MCP), gpt-image-1-mini, Gemini, gte-small, rembg, Real-ESRGAN, Manus, DeepL
Automation	n8n, GitHub Actions, Supabase Edge Functions, pg_cron, Apify, Formspree, OneUp
Front-end	TypeScript, React 19, Next.js 16, Vite, Tailwind 4, GSAP, Three.js, Lenis, shadcn/ui
Data and back-end	Supabase (Postgres, pgvector, RLS), Firebase, Node, Python, Playwright, ffmpeg
Platforms	Vercel, GitHub, WordPress and Elementor, Wix Studio, Shopify, OMIE, HubSpot, Focus NFe
Marketing	Meta Ads, Google Ads, Local Services Ads, Search Console, GA4, Rank Math, Google Business Profile
Quality	Playwright with axe (accessibility), Lighthouse CI, Vitest, security headers

How I work

I don't make up data.

Address, price, testimonial and metrics only go in if they exist. Whatever is missing becomes a pending item for the client.

A person approves.

AI writes the draft. Publishing, billing and issuing invoices are a human click.

Measure before and after.

Every performance change ships with the old number next to the new one.

Everything on record.

Decisions and deliveries go into the vault with a date, right away.

Got a process that could run on its own?
